

# Drone as a Service

**(DAAS) – Fully autonomous drone and remote training program empowers clients and partners to perform inspections with in-house technicians.**

## A Step Forward

Continued development of our Clobotics IBIS™ AI drone technology has led us to a new milestone on our journey. We are now able to train your personnel to inspect wind turbine blades with the press of a button, offering an unprecedented level of autonomy and flexibility to your blade inspection jobs.

## Flexible Training – And Operation

To meet the global demand for high quality inspections, Clobotics has developed a comprehensive training program which can be tailored for technicians with different skill sets. Clobotics offers a comprehensive training course that takes two days and covers all that is needed to perform the inspections confidently, safely and efficiently.

## Reduced Cost

The cost of mobilization for a blade inspection campaign can be greatly reduced. You can rely on your own personnel and reduce the travel, weather and other expenses often associated with using contracted personnel.

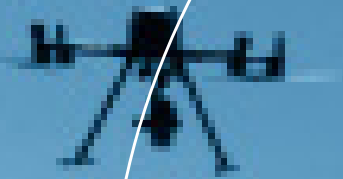

## Inspection Made Easy

A blade inspection campaign sets up easily – simply decide on the number of wind turbine generators (WTGs) you want to inspect and when you want to do it – Clobotics will then help you with getting the equipment and training needed to do the job.

## More flexibility, less cost.

Remote locations and unpredictable weather demand flexibility when accomplishing wind turbine blade inspections. Clobotics Drone as a Service (DaaS) offering delivers by enabling your personnel to accomplish the job using our push button IBIS™ drone technology. Gain flexibility and avoid the travel, CO2 emissions and weather downtime expenses associated with contracted inspectors.

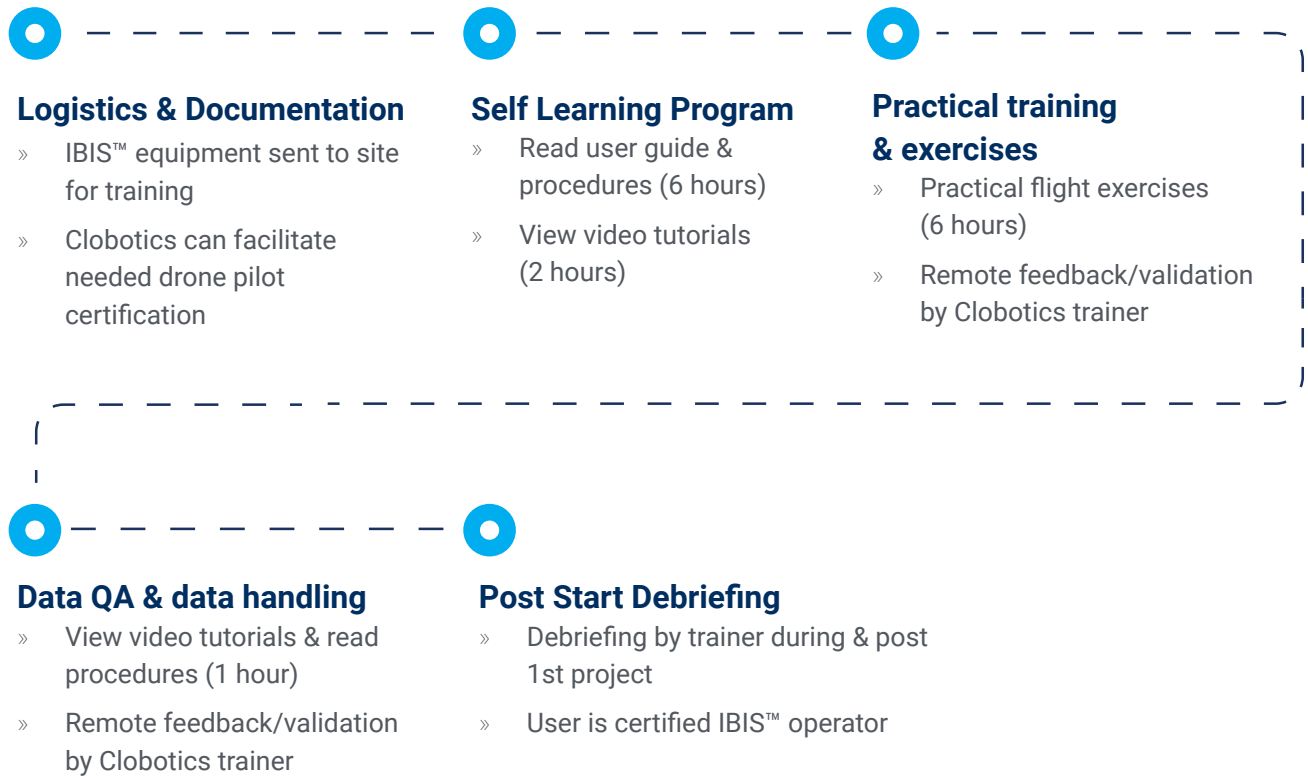

### Become IBIS™ Certified

After a 2 day compressed course operators can be IBIS™ certified. IBIS™ is a DJI M300 drone customized with a high-resolution camera and an onboard computer. IBIS is custom programmed to fly very efficiently around the wind turbine generator (WTG) with no human intervention gathering very high-resolution images and accurate location information about where those images are on the blades.
